DETAILED ACTION

1. This Office Action is the answer to the Amendment filed on January 16, 2007, which paper has been placed of record in the file.
2. Claims 1-5 and 7-12 are pending in this application.

Allowable Subject Matter/Reasons for Allowance

3. Claims 1 and 8 are allowed over the prior arts cited records.

The closets prior arts are:

1) Rickard (US 6,016,483) discloses a computer-based system for determining a set of opening prices for a number of series of options traded on an options exchange and for allocating public order imbalances at the opening of trading. Market makers input a current position, a desired target position and market maker orders for options series from market maker terminals. An order entry system receives public orders for options series. A controller determines a set of implied volatilities (prices) for each options series that will maximize a weighted volume of trades across all option series at the opening. Contra orders that can be matched at the opening price are then executed. If there is a residual imbalance of non-executed public orders, the residual imbalance of non-executed public orders is assigned to individual ones of the plurality of market makers so as to minimize a cumulative measure of deviation between the desired target position and the current position of each market maker. The system is applicable to an options exchange, this term including any facility operating an over-the-counter market in options.

2) Alaia (US 6,230,146) discloses a method and system for conducting electronic auctions is described. A dynamic lot closing extension feature avoids collisions in closing times of multiple lots by dynamically extending the closing time of a subsequent lot if a preceding lot's closing time is extended to be too close to the subsequent lot's then-currently scheduled closing time. Scheduled closing times can be extended with a flexible overtime feature, in which the properties of the event triggering the extension and the duration of the overtime period(s) can be tailored to a particular auction, particular lots of products within an auction, and to the particular time within an auction process. The bidding status of a lot can be set to a "pending" status after the nominal closing time for submission of bids to allow bidders to alert the auction coordinator of technical problems in submission of bids. This allows the possibility for a lot to be return to open status for further bidding by all bidders. The auction may be paused by the auction coordinator to correct technical, market and miscellaneous problems that may arise during the course of an auction. Individual bid ceilings can be set for each bidder so that they are required to bid lower than certain thresholds determined in advance of the auction. Failsafe error detection is performed to prevent erroneous bids from entering the auction. The auction coordinator has the ability to override any erroneous bids that are entered to prevent prejudice to the auction

Therefore, it is clear from the description of Rickard's and Alaia's inventions that the prior arts do not considered the possibility of: receiving additional quotes and orders associated with the option class during a second time period and responsively updating the opening prices prior to the opening of trading and randomly terminating the second

time period prior to an opening rotation period such that further additional quotes and orders are not considered in updating the opening prices, as included in claims

1 and 8.

4. Claims (2-5, 7) and (9-12), are allowed because they are dependent claims of the allowable independents 1 and 8 above, in that order.

Conclusion

5. Claims **1-5** and **7-12** are allowed.
